

A 3D rendering of a multi-roller extrusion system. The rollers are grey and arranged in a line, with a stream of material being extruded from the right. The stream is composed of many small, colorful particles (blue, pink, and purple) that form a curved, arching shape. The background is white.

# ZSK Mc<sup>18</sup> – Design Criteria

$D_o$  = Outer diameter

$D_i$  = Inner diameter

$a$  = Centerline distance

$D_o / D_i$  = Diameter ratio  
determines shear, degassing and powder intake

$M_d / a^3$  = Specific torque  
determines power density and filling degree

$n$  = Screw speed  
determines shear and mixing

## Optimal $D_o/D_i$ of 1.55

The shafts reliably withstand the high mechanical stress and the screw elements feature high wear resistance

$D_o/D_i$  of 1,55 enables reliable scale-up within the whole Mc<sup>18</sup> series

$D_o/D_i$  of 1,55 enables scale-up and modernization of ZSK Mc PLUS to the ZSK Mc<sup>18</sup> series

## Increase in torque of 30%

Increase in throughput from up to 30% to 100%

Improved compounding quality by gentle processing with a higher filling degree

Maximum flexibility due to broader operating window

Reduced melt temperature at higher output

Increased energy efficiency by reduced specific energy input

Significantly improved productivity

Proven high ZSK safety enabled by new designs and developments
